Swisspearl Largo Gravial

Remarks

This DIM (Design + Installation Manual) provides technical information regarding design and installation. Refer to area manager and local distributor for further information such as:

- Terms of delivery
- Pricing
- Products and colors
- Lead time, etc.

More general information available on www.swisspearl.com

CH- 8867 Niederurnen
Tel. +41 55 617 11 60
Email: info@swisspearl.com

Validity of DIM

Please consult your local distributor and or the Technical Advisor prior to the commencement of shop drawings or installation for the most current DIM guide. The current DIM can always be found at www.swisspearl.com. All previous DIM guides should be disregarded and are no longer valid.

Product warranty

20 year warranty for the functional quality of panels and accessories, provided that the installation is in full compliance with this DIM.

Maritime conditions

Maritime conditions call the use for stainless steel rivets. Those may be used on steel or anodized aluminum sub frame. Maritime conditions are considered 50m to 1km (0.03 to 0.6 miles) from the sea. Material specification for sub frame, fasteners and accessories to cater for maritime conditions according to local standards.

Advantages of fiber cement products

- Maximum protection against weather
- Excellent longevity
- Easy installation in any climate
- Almost no maintenance required
- Proven details
- No cracks, paint or sealant problems
- High sustainability
- Non combustible

Project specific ordering

Subtle visual differences may occur between product batches. Therefore we recommend ordering by job or specific elevation if ordering in phases.

Disclaimer

The information and recommendations contained in this Design & Installation Manual (“DIM”) are offered as a service to architects, constructors, installer and other persons involved with our products and are not intended to relieve them from their own responsibility. The information and recommendations provided herein are believed by Eternit (Schweiz) AG (“Eternit”) to be accurate at the time of preparation of this DIM, or obtained from sources believed to be generally reliable. Eternit makes no warranty concerning the accuracy of the content of this DIM and shall not be liable for claims relating to any use regardless of whether it is claimed that the information or recommendations are inaccurate, incomplete, or otherwise misleading. The information and recommendations herein are intended to be used with the judgment and experience of professional personnel competent to evaluate the significance and limitations of the material contained. Eternit expressly disclaims any guarantees or warranties, expressed or implied, for anything described or illustrated herein and assumes no responsibility or liability for damages of any kind, including - without limitation - bodily harm, injury or damage to property inferred from this DIM or the use of the materials described herein.
Swisspearl Largo Gravial

Overview panel sizes

Program I Sizes

Overview panel sizes

Product data
- Density > 1.8g/cm³
- Modulus of elasticity ca. 15'000 MPa
- Characteristic value for bending strength (average) ca. 22.4 MPa
- Thermal expansion coefficient 0.01 mm / m / °K
- Fire classification according to NFPA 285 EN 13 501-1 & A2-s1, d0
- Frost resistance and durability under EN 12467
- Thermal range - 40°C to + 80°C

Overview of colors and panels available see: «Swisspearl Design Solutions, products and system».

Variants of structure
Further design router variants on request:
- 1 Portrait Panel Typ L
- 2 Landscape Panel Typ Q

The type must be specified when ordering whole panels. (cut to size on site)

</tbody>
</table>

Application

Swisspearl Largo panels can be attached to vertical timber or metal profiles. Suitable for new facades or existing cladding renovations.

Untrimmed full size panels

Untrimmed panels will only be provided to approved fabricators. Untrimmed Swisspearl Largo panels must be trimmed 10 mm on all four sides.

Sealed cut edges

All panel edges cut on site or at fabricators workshop must be sealed by LUKO sealer, provided by Swisspearl.

Signage, light fittings, etc.

Provide structural attachment points behind the panel as required. Leave generally min. 6 mm (¼”) free gap between panel edge and installation - so as not to constraint the panel movement.

Additional panels without engraving

Supplementary panels are from the standard Carat and Nobilis range available.
Adhesive technology
Specially ordered ARSB panels are signified by printed squares on the backside of the panel. Please consult with your adhesive manufacture prior to installation. Zenor panels only available for face fastened system.

General requirements
Glue manufacturer’s instructions for use must be strictly followed regarding all aspects, including:
• Cleanliness of panels and support profiles
• Panel and air temperature
• Air moisture content
• Etc.

Support profiles
• For exterior application the panels may be glued to aluminium supports only.
• Sub framing to be approved by glue manufacturer prior to stating the installation.

Panel ordering
Panels ordered for adhesive application are called ARSB and are available upon request at time of order. Standard Swisspearl panels cannot be used for adhesive application.

Warranty
Panel manufacturer provides functional warranty for the panels only. Warranty for the attachment of the panels to be obtained by glue manufacturer.
**Character**
Large format Largo Gravial fiber cement facade panels, with a concealed system, consists of a high quality design, which represent the pure principle of a ventilated facade without any visible attachments.

**System description**
The Sigma 8 system consists of 9/12 mm thick Largo Gravial panels with a maximum size of 3050 × 1250 mm; with undercut anchors on the rear side and attachment cleats that are fastened to vertical sub frame profiles made out of timber battens or metal profiles out of aluminium or galvanised steel. The drilling of the undercut holes and the gluing of the anchor inserts into the holes requires high precision and must be carried out at the factory in Niederurnen, Switzerland.

All attachment cleats are installed on site. The panels are cut to size and packed onto pallets at the factory according to dimensions provided by the customer.
**Program I Fasteners**

**To timber battens**
1. Screw, inox, saucer head Ø 12 mm, T20 drive, blank or powder coated
   - 4.8 x 30, 4.8 x 38 mm
   - 4.8 x 44, 4.8 x 60 mm
2. Torx bit T 20 W

**To aluminium profiles**
3. Aluminium rivet head Ø 15 mm, blank or powder coated
   - 4.0 x 18-K15, 9-14 mm grip range
   - 4.0 x 24-K15, 13-18 mm grip range
   - 4.0 x 30-K15, 18-23 mm grip range
4. Fixed point sleeve aluminum type 8

**To steel profiles**
5. Stainless steel rivet, head Ø 15 mm, blank or powder coated
   - 4.0 x 18-K15, 9-14 mm grip range
   - 4.0 x 23-K15, 14-19 mm grip range
6. Fixed point sleeve stainless steel type 8

**Maritime conditions**
Maritime conditions call the use for stainless steel rivets. Those may be used on steel or anodized aluminum sub frame. Maritime conditions are considered within a distance of 1 km (0.6 miles) from the sea. Material specification for sub frame, fasteners and accessories to cater for maritime conditions according to local standards.
Joint material

1. EPDM band, black, 60 mm wide for intermediate supports with side lips, in 50 m rolls
2. EPDM band, black, 100 & 120 mm wide for butt joints with side lips, in 50 m rolls
3. EPDM band, black, 150 mm wide for inner and outer corners with side lips, in 25 m rolls
4. Ventilation profile, raw aluminum or standard colors, 50 × 30 mm, 70 × 30 mm, 100 × 40 mm, 2500 mm long, 0.6 mm thick
5. L-flashing, stainless steel, millor powder coated, 0.5 mm thick 2510 / 3050 mm long
6. Horizontal joint flashing, aluminium, powder coated black, 0.5 mm thick 2510 / 3050 mm long
**Terminology**

1. **Cladding (1)**
   Panels with open or closed joints, in one plane or lapped.

2. **Sub framing (2)**
   To support the cladding dead and wind load generally vertical panel supports in timber or metal.

3. **Rear ventilated cladding**
   The design principle involves the deflection (screening) of the rain water. As the panel joints are not sealed, minimal amounts of water can gain access into the air cavity behind the panel. The cavity is naturally ventilated by vent gaps at bottom and top, so that any moisture will evaporate naturally by thermal action.

4. **Ventilation cavity (3)**
   Cavity behind panel with ventilation gaps at bottom and top.

5. **Thermal insulation layer (4)**
   To increase the thermal insulation capacity of the exterior wall.

6. **Substrate (5)**
   Face of exterior wall, such as plaster, concrete, exterior sheathing, wind proofing layer, etc.

7. **Exterior wall (6)**
   Brick, concrete, wood and steel studs
**Application**
Swisspearl cladding panels can be attached to vertical supports made of timber, aluminium or steel.

**Windload**
Always consider local standards when determining windloads and related panel fastener distances. This is especially important for tall buildings, for buildings with special shapes and for high wind exposure areas.

**Ventilation cavity**
Building tolerances must be allowed for. The cavity may not be reduced by horizontal profiles or any stray objects such as loose insulation and other materials.

**Ventilation cavity with perforated horizontal subframe components**
Min ventilation gap to be 40 mm. Horizontal profiles should allow min. 75% airflow. In advance please contact your Technical Service for approval.

**Building expansion joints**
The building's structural expansion joints should be considered when designing subframe systems. Structural expansion joints must be applied to sub frame and cladding as provided to the building structure.

---

**Corner zone**

**Wind load zones**
As per scheme there are two wind load zones. The corner zones generally are subject to increased negative wind load (suction) due to turbulence at the edges of the building. The applicable wind load values must be determined in the cladding specification.

**Min. manufacturer cavity depth:**

<table>
<thead>
<tr>
<th>Cladding height</th>
<th>min. cavity</th>
</tr>
</thead>
<tbody>
<tr>
<td>≤ 6 m</td>
<td>20 mm</td>
</tr>
<tr>
<td>6 - 30 m</td>
<td>30 mm</td>
</tr>
<tr>
<td>&gt; 30 m</td>
<td>40 mm</td>
</tr>
</tbody>
</table>

Mandatory for issuance of the warranty letter.
### Panel support
Panel must be supported on an even surface. If perforated angles are placed between the panel and batten/vertical profile the closure piece must not exceed 0.8 mm. Perforated angles have to allow ventilation entrance with a min. perforation of 60%. The use of an aluminium mesh is possible. It has a high ventilation ratio, thin material thickness (no push out of panel) and is easy to install.

### Material compatibility
Untreated aluminum material such as Window sills, frames, etc. is not compatible with cement and must be protected against dust from drilling panels, etc. Aluminum components are to be used in anodized or powder-coated or Kynar Coated for exterior applications with protective films.

### Sealant material
Generally to keep the cladding maintenance free the use of sealants should be avoided. Where the use of sealant is unavoidable Polyurethane, Acrylic or Hybrid Polymer products would be best suitable. Before applying any sealant to fiber cement material the compatibility must be checked as certain materials leave permanent staining on panel surface.

Design | General remarks

Reference lines
The planning of vertical joints can be done with a maximum panel usable dimension. Aesthetically the building corners or certain reference lines can be divided. The lintels should be considered as horizontal reference lines.

Panel width
The minimum panel width for portrait Gravial panels is ≥300 mm. In case of continuous vertical stripes, control that the Gravial lines are even. The height of the landscape Gravial panel is ≥300 mm.

Min. panel width
Should you consider a smaller width, please get in touch with your Swisspearl Technical Advisor.

Fastener distance
For fastener distances on Gravial panels ≥300 mm, see Largo large size format documentation.
Design | Metal supports

Swisspearl rivet Ø 15 mm 4.0×18-K15

Holes in panel for rivets
Diameter 9.5 mm

Standard edge distances
Horizontally 29 mm
Vertically 80 mm

Minimum edge distances
Horizontally 29 mm
Vertically 60 mm

Panel edge distances

Fixed, sliding points
Each panel must be fastened by 2 fixed points in the panels center to support the panels deadload. All other rivets are sliding points.

Drill holes Ø 4.1 mm to metal profiles
Use centering drill gauge so the holes will be concentric to the Ø 9.5 mm hole in the panel. Use drill bit type A for aluminum profiles and type S for steel.

Sub-frame engineering
Engineer / contractor is responsible for the design and installation of all sub frame parts including all pertaining fasteners.

The sliding point connection is NOT meant to accommodate building drift or seismic movement.

Maximum edge distance
Horizontally and vertically 100 mm

Panel joints
Typical panel joint is 8 mm, this allows panel scraps to be used as spacers. Wider joints will make any inaccuracies in the installation less noticeable.
Design I **Metal supports**

**Sub frame examples**

1. Swisspearl Largo Gravial 9/12 mm
2. Vertical profile T-profile 120 mm
3. Intermediate profile, L-profile 45 mm
4. Vertical profile, T-profile 140 mm
5. Rivets 4.0 x 18-K15

**T-Profile 120 mm**
- Continuous Gravial grid

**T-Profile 140 mm**
- Individual Gravial grid

**Intermediate support L-profile 45 mm**
- Continuous Gravial grid

**T-profile 120 mm and L-profile 45 mm**
- Individual Gravial grid
**Design | Metal supports**

**Panel Planning**

**Installation planning**
The arrangement of the sub-frame will always depend on the grid of the engraving.

**Calculation example:**
Panel width minus lateral edge distance due to raster engraving = number of millings

Even = X
Uneven = A; B

**Jobsite fabrication**

**Gravial cutting**
When Gravial panels are cut on site, please note that minimum edge distance of 4 mm remains.

All cut edges must be afterwards treated with Luko sealant.

**Detail engraving Gravial grid**

**Onsite Gravial fabrication**
**Aluminium profiles**
Aluminium thickness should be a min. of 2 mm. Profiles should not exceed 3 m and profile breaks should coincide with panel joints.

**Aluminium rivet**
4.0 × 18 - K15 rivet, head Ø 15 mm, powder coated or blank, grip range 8 - 13 mm.

**Staggered horizontal panel joints**
Use two vertical profiles to vertical panel joint so that each can be broken on its horizontal panel joint leven.

**Black panel joints**
Panel joints read as shadow lines. It is recommended to blacken the metal where visible, with paint or PVC paint tape.

**Steel profiles**
Steel panel supports to be min. gauge 18 (1.27 mm / 0.05”) to obtain nominal pull out value. Profiles should not be longer than 6 m (20').

**Stainless steel rivet**
4.0 × 18 - K15 rivet, head Ø 15 mm, powder coated or blank, grip range 9 - 14 mm.

**Sub-frame engineering**
Engineer / contractor is responsible for the design and installation of all sub frame parts including all pertaining fasteners.

---

1 Swisspearl Largo Gravial 9/12 mm
2 Rivet
3 Panel support profile
4 Joint flashing (optional).
5 Thermal insulation

Any breaks to panel support profiles must be located at panel joints as shown. Flashing cut at one vertical as shown to prevent lateral dislocation of flashing.
Horizontal section

Panel may be cantilevered max. 400 mm.

1. Swisspearl Largo Gravial 9/12 mm
2. Rivet
3. Aluminum profile
4. Thermal insulation

Design | Metal supports
Rivet installation
Use rivet gun GESIPA ACCUBIRD or similar. Do not use pneumatic equipment. Use centering drill gauge with drill bit Ø 4.1 mm to obtain concentric hole [A/3].

Fixed point for Aluminum Sub-frame
Fixed point for Aluminum, Type 8 Ø 9.4 mm [B/4]
• Rivet head Ø 15 mm 4.0 × 18-K15, blank or powder coated, grip range 8-13 mm

Fixed point for Steel Sub-frame
Fixed point steel A2, Type 8, Ø 9.4 mm [B/4]
• SS Rivet, head Ø 15 mm, 4.0 × 18-K15, blank or powder coated, grip range 9-14 mm

Each panel must be fastened by 2 fixed fastening points in the panel center, installed first. All the others are sliding points.

Sliding points for Aluminum Sub-frame
Use centering drill gauge with drill bit Ø 4.1 mm to obtain concentric hole [C/5]
• Alu Rivet, head Ø 15 mm 4.0 × 18-K15, blank or powder coated, grip range 8-13 mm. Sliding points for Steel Sub-frame use centering drill gauge with drill bit Ø 4.1 mm to obtain concentric hole [C/5]

Sliding points for Steel Sub-frame
• Sliding points for Steel Sub-frame. Use centering drill gauge with drill bit Ø 4.1 mm to obtain concentric hole [C/5]
• SS Rivet, head Ø 15 mm, 4.0 × 18-K15, blank or powder coated, grip range 9-14 mm

1 Support profile

The data was evaluated according to ETAG 034 using 9/12 mm Gravial panel, and includes no safety factor. Diameter of panel hole must be 9.5 mm, and rivet head must be 15 mm. Min. thickness for steel profiles to be 1.27 mm, and 2 mm for aluminum. Edge distances 29 mm horizontally, 80 mm vertically. The data may be interpolated.
**Design | Metal supports**

**Single span no intermediate support**

Max. distance between fasteners for single span panels 570 mm, unless smaller distances is required by high wind load as per table of fastener distances.

If more than 5 single span panels are adjoining each other - the chain of fixed points must be interrupted by a different configuration of the fixed points.

Consult with technical advisor.

**Single span**

Fixed point Ø 9.5 mm [F]
Sliding point Ø 9.5 mm

**Soffit panels**

Fastener distances for soffit panels and suspended ceilings not to exceed 500 mm.
Design I Metal supports

Sample rivet layouts, final layout to be determined by a local structural engineer.

Swisspearl Largo vertical panel (portrait)

- Fixed points [F] center and left.
- If no rivet at half height go with [F] to row above.

Swisspearl Largo Gravial

- Fixed point Ø 9.5 mm [F]
- Sliding point Ø 9.5 mm
Design | Metal supports

Sample rivet layouts, final layout to be determined by a local structural engineer.

Swisspearl Largo horizontal panel for odd number of rivets

Between fixed points, the max. distance can be 1 sliding point.
Sample rivet layouts, final layout to be determined by a local structural engineer.

Swisspearl Largo horizontal panel (landscape) for even number of rivets
Example outer corner

Swisspearl screw

Swisspearl screw, stainless steel, saucer head Ø 12 mm, T20 drive, 4.8 × 38 mm.

Panel hole
Diameter 5.5 mm

Standard edge distances
Horizontally 29 mm
Vertically 80 mm

Minimum edge distances
Horizontally 29 mm
Vertically 60 mm

Maximum edge distance
Horizontally and vertically max. 100 mm

Panel joints
Typical panel joint is 8 mm, this allows panel scraps to be used as spacers. Wider joints will make any inaccuracies in the installation less noticeable.

Installation
The screws must be installed with depth stop at 90 degrees set to the panel. The screw head must rest even to the panel.

Sub-frame engineering
Engineer / contractor are responsible for the design and installation of all sub framing parts including all pertaining fasteners.

Timber battens
Straight grown pine, dry (max. 20% moisture content).
Design I **Timber battens**

**Fastening on timber battens**

1. Swisspearl Largo Gravial 9/12 mm
2. EPDM band 120 mm
3. EPDM band 60 mm
4. EPDM band 150 mm
5. Battens 27 × 120 mm
6. Battens 27 × 60 mm
7. Battens 27 × 150 mm
8. Screw T20 4.8 × 38 mm

**Shock training**

With individual vertical joints, you have to use the vertical butt (120 mm 150 mm) by 30 mm to the division axis.
Design | Timber battens

Panel planning

Installation planning
The arrangement of the sub-frame will always depend on the grid of the engraving.

Calculation example:
Panel width minus lateral edge distance due to raster engraving = number of millings

Even = X
Uneven = A, B

Jobsite fabrication

Gravial cutting
When Gravial panels are cut on site, please note that minimum edge distance of 4 mm remains.

All cut edges must be afterwards treated with Luko sealant.
Timber battens
Installation over timber battens is allowed provided the design meets local engineered codes and standards.

Timber quality
Battens must be thickness gauged to 1 face:
- Thickness min. 27 mm (min. 3/4”)
- Always use planed surface timber
- Solidity class II (FK II/C24)
- Recommended only using kiln-dried lumber
- Moisture content max. 20-%
- Timber must be of equal of higher quality

Vertical battens
At panel joints:
2 × 27 × 60 mm or
1 × 27 × 120 mm
Intermediate supports:
27 × 60 mm

Engineering
Battens including their attachment to be engineered per local standards.

Battens screw
Screw Ø min. 6 mm
Head Ø min. 12 mm
For battens wider than 60 mm use two screws per point of attachment. Rear ventilation, thermal insulation, moisture proofing, wind proofing layers. All local standards are applicable and must be complied with.

Joint flashing
Horizontal joint and L-flashing should be 2 mm shorter than panel and thus not visible in vertical joints. If required butt joint the flashings on any batten, do not overlap flashing.

L-flashings and horizontal joint flashing are not 100% water-proof! Therefore all timber battens must be fully covered by EPDM bands to protect them against moisture and to prevent rotting and the growth of fungi and mold.

EPDM strips
All timber battens must be fully covered by EPDM backing strips stapled to the battens. Stapled at the edges of the bands. EPDM strips to be in one single piece top to bottom or overlapped as per diagram.
Butt joints with EPDM bands should be avoided if possible. Should the formation of butt joints be unavoidable, the batten must be released 3 mm and the overlap of the band be 40 mm.

**Horizontal panel joint**

**Horizontal section through vertical battens**

**EPDM joints**

1. Swisspearl Largo Gravial 9/12 mm
2. Screw
3a. EPDM band 60 mm
3b. EPDM band 120 mm
3c. EPDM band 150 mm
4. Batten 27 × 60, 27 × 120 mm
5. Joint flashing
Design | Timber battens

Above table is a guide line for 2 or more fasteners in vertical and horizontal direction. The spacings originate from 1230 × 3050 mm full size panels with equal distances between screws. Data may be interpolated.
Engineering responsibility
The spacings in above table are provided as indication. For the actual cladding design a locally licensed engineer shall assume responsibility for calculation and verification.

Panel data
- Modulus of elasticity
  MOE ca. 15'000 MPa
- Characteristic value of bending strength (average: lengthwise / crosswise) or MOR (average) 22,4 MPa
- Density > 1.8g/cm³

The data was evaluated according to ETAG 034 using 9/12 mm Gravial panel, and includes no safety factor. Diameter of panel hole must be 5.5 mm, and screw head must be 12 mm. Minimum screw engagement in timber to be 27 mm. Edge distances 29 mm horizontally, 80 mm vertically. The data may be interpolated.
Design | **Timber battens**

**Single span panel (no intermediate support)**

Max. distance between fasteners for single span panels 563 mm, unless smaller distance is required by high wind load as per table of fastener distances.

**Soffit panels**

Fastener distances for soffit panels and suspended ceilings not to exceed 500mm.
Design I Timber battens

Sample screw layouts, final layout to be determined by a local structural engineer.

**On site storage**
Pallets must be stored under cover i.e. out of rainfall and direct sunlight. Where this is not possible, store under tarp. Ingress of water into stacked panels will cause permanent staining to panel surface. Excess heat to stacked panels can cause damage to panel surface. Overseas pallets can be stacked several above another.

Provisional roofing or tarp covers are to be used in a manner that allows cross ventilation as shown.

**Fabricating panels at local fabricators or on site**
Always work out of the weather. Cutting panels to size:
- Use industrial vertical panel saw for large quantities
- For small quantities use circular hand saw with straight edge and dust extraction
- Panel cut outs, etc. use jig saw
- Cutting blade supplied by factory or procured locally, considering cutting quality, performance, costs
- Dust from fabricating on site must be removed immediately
- Avoid tools which produce fine dust

**Stacking panels on site**
- Always stack the panels horizontally on pallet base
- Each stack should not be more than 500 mm high (1’ 18’’)
- Use foam protection layer between the panels (as supplied by factory)
- 5 stacks on top of each other

**Pallet sequence**
It is recommended to order the panels cut and pre-drill according to their sequence in the order to safe time while installing.

- Do not pull panel across...
- ...but lift up vertically
Panel fabrication on site
For long cuts use multifunction table with circular hand saw, guide rail and dust extractor. Saw blade supplied by panel manufacturer or at own choice.

Cut outs
For smaller cut outs or odd shapes use pendular jig saw. For drilling use spiral drill bits on site storage Ø 9.5 / Ø 5.5 mm (metal / timber supports) with carbide metal tips supplied by panel manufacturer or procured locally.

Sealer to cut edges
All cut edges must be sealed with impregnation liquid LUKO. Immediately wipe Luko off the face of the material.

LUKO hand applicator
LUKO filled in hand applicators is frost proof to -8°C (18°F). LUKO supplied in 1 liter bottles is not frost proof but dries faster (for fabrication in work shop).

Tools
Drill
Jig saw
Rivet gun
Center drill gauge
Depth stop Gravial (mandatory for timber sub-frame)

Circular hand saw with guide rail and dust extraction
Swisspearl panels including
Including those panels with an added Façade and or Roof coatings fall into these categories.

Cleaning procedures
Remove dust immediately after fabricating panels.

Dry dust
To be removed with a vacuum cleaner, or with a clean, dry and soft cloth or brush.

Wet dust
Results in staining the panel surface. It must be removed immediately, using plenty of water and a sponge or soft brush.

Cleaning of completed claddings
Non calcium based stains:
• Use high pressure cold water at max. 80 bars (minimum distance from panel 25 cm/10"). Use flat fan spray nozzle, dirt blasters are not allowed. Prior do test on inconspicuous part of cladding
• If required use mild soap or dishwashing liquid. Do not use abrasive or solvent containing cleaning agents.
• Do not use glass cleaning detergents!
• Never wash claddings in direct sun light with alkaline or acid cleaners, as the detergent may cause irreversible stains.

Calcium based stains:
• Apply a mist spray of a solution of 9.5% acetic acid and water
• Allow to react a few minutes but do not let dry out
• Use high pressure cold water to rinse cladding

Repeate steps 1 to 3 on difficult stains.

Cleaning during service life
Normally no cleaning will be needed since the rain will periodically wash away dust, environmental dirt, etc. However, if particular environmental conditions lead to a dirty surface, wash with garden hose or high pressure cold water.

The installation of Gravial panels is thought as vertical grids, in order to avoid dust sitting on the engravings. Should a horizontal grid be considered, technically possible, keep in mind that dust might sit and stain the panels.

Organic growth
Remove algae / fungi with a 5% solution of hydrogen peroxide (H2O2) to eliminate all spores.

Masking tape
For the use of masking tape on panels it should be noted that most common masking tapes are not resistant to UV rays. Such tapes leave behind residues, that cannot be removed without causing damage to panel surface. However the use of the following masking tapes is recommended:
• Masking tape 3M Blue 2090 for temporary application (1 - 2 weeks)
• Masking tape 3M Gold 244 for longer term application.
